PRACTICE 7.3:

Explain what the following program prints:

```c
int main() {
    double m[100];
    double *p1, *p2;
    p1 = m;
    p2 = &m[6];
    printf("%lld", p2 - p1);
}
```

Explain: The program will print the distance between the two pointers p1 and p2, which means it will print the number of elements from m[0] to m[5] so it will print 6.
